Activity: Exploring and Improving AI Prompts

For this activity, I used ChatGpt to generate an image of a school. For my first prompt I said “Make me a photo of a school” then it gave me a beautiful, modern school building with a clean entrance, green trees, a wide driveway, and a bright blue sky. The school looked peaceful, organized, and welcoming to students.

The second prompt is about creating a realistic photo of a beautiful girl entering Ateneo de Davao University while a security guard checks her bag at the school entrance. The girl has brown hair, a light-to-medium skin tone, wears a school uniform, and carries a luxurious Birkin-style bag. The picture shows the school gate with the university's name and logo, trees and buildings around the campus, and a security guard carefully inspecting the girl's bag before she enters.

The main difference between the first and second prompts is that the first prompt, “Make me a photo of a school,” focuses only on the school building and its surroundings. It is a simple and general instruction that allows the AI to create a school image with minimal details. In contrast, the second prompt, “Make me a photo of a beautiful girl entering Ateneo de Davao School in school uniform with her Birkin bag checked by a guard. Brown hair, light to medium skin tone,” provides more specific instructions about the subject, appearance, clothing, belongings, location, and activity. The first prompt produces a picture highlighting the school's architecture, cleanliness, and welcoming environment, while the second produces a more detailed scene showing a student entering the campus as a security guard inspects her bag. This comparison shows that prompting is important because the more specific and detailed the prompt is, the more accurately the AI can follow the user's intended idea.
